

## **Advice on installation of Windows drivers for the USB data cable**

Please install the FTDI-USB drivers onto your PC before connecting the USB online cable to your computer.

If an installation CD has been delivered, start the program „CDM 21228\_Setup.exe“, and follow the instructions shown on screen.

After installation, connect the cable to the PC. You will find the entry „USB Serial Port (COMx)“ under the rubric „Ports (COM & LPT) in the device manager. „X“ means the number of the assigned virtual COM port. This port is the one to be selected in the evaluation program of the data logger to establish data connection. You also have the option to proceed as normal using automatic hardware detection.

You will also find the current drivers and advanced information on driver installation on [www.ftdichip.com](http://www.ftdichip.com).
